Poon, R.Y.C. (2016) Cell cycle control: a system of interlinking oscillators. *Methods Mol. Biol.* 1342: 3-19.

Research Aims and Interests

Our group has been interested in understanding the molecular basis of cell cycle control in normal and cancer cells. Recent interests include the mechanisms that regulate mitotic exit. We are also interested in how cells cope with the various stresses that compromise DNA integrity and chromosomal instability. Several proteins that regulate these pathways, including p31<sup>comet</sup>, MASTL(Greatwall), and poly(ADP-ribose) polymerase 1 are being studied.
